Meginniðurstaða vettvangsrannsóknar

Opnað var eitt samfellt rannsóknarsvæði, 80m² að stærð, til hliðar við eldri rannsóknarsvæði, með það fyrir augum að afhjúpa grunsamlega þúst sem talin var vera kuml. Reyndist þetta vera rétt og fundust tvær grafir. Innihélt önnur (sú nyrðri) leifar af hrossbeinagrind og nokkuð af járngrípum, en í hinn (þeirri syðri), fundust engin bein. Þar fannst þó einn gripur úr viði og brónsi ásamt nokkrum járnnöglum. Tvær tennur úr manni og hugsanlegt brot af höfuðkúpu fundust þó rétt utan við syðri gröfina. Fjórar grjótfylltar stoðarholur fundust svo umhverfis syðri gröfina.

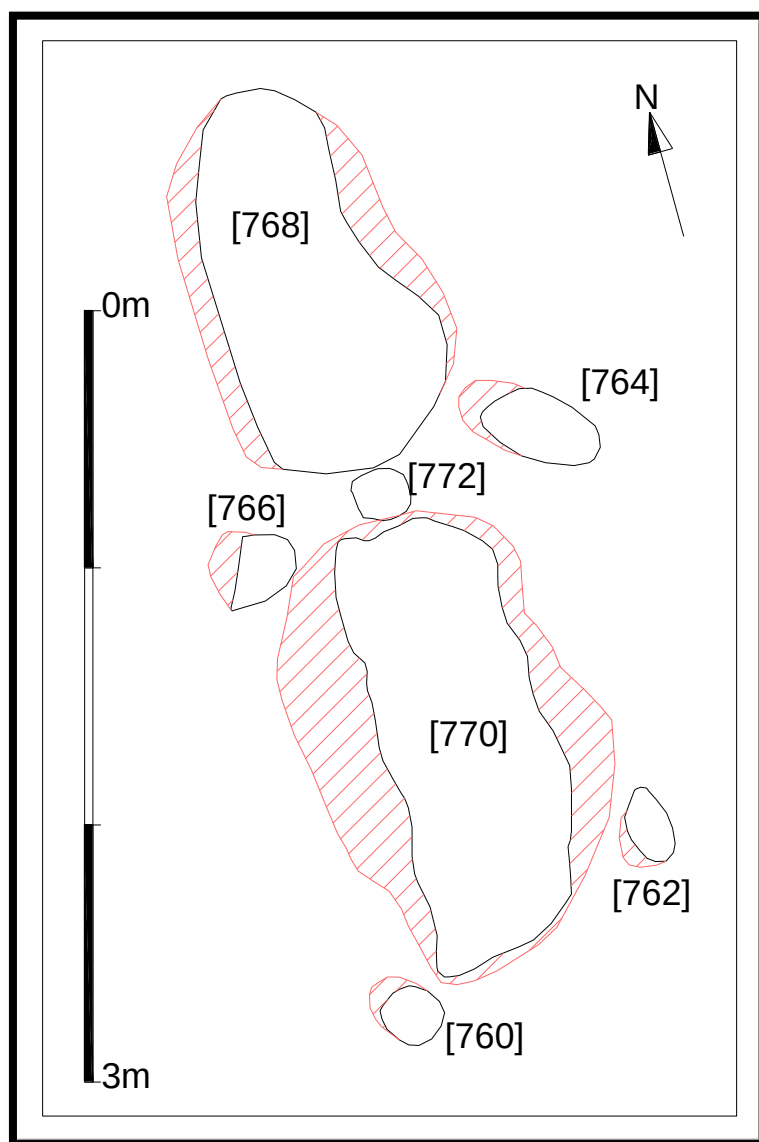

Figure 1 - Plan of excavated features - undercut elements in red.

Aims

A team from Fornleifastofnun Íslands continued excavations at Ingiríðarstaðir in Þegjandadalur between August 4th and August 15th 2014, on behalf of Hið Þingeyska Fornleifafélag. The project aims to completely excavate a large pre-Christian gravefield, along with associated features.

The team comprised Howell Magnus Roberts, Lísabet Guðmundsdóttir, Þóra Pétursdóttir, Gísli Pálsson, Morten Ramstad (UiB) and Brenda Prehal (CUNY).

An area of 80m² was opened as a single contiguous area, adjoining previous excavation areas. This targeted a surface anomaly, thought likely to be a disturbed grave. This proved to be correct.

Methods

The standard excavation methodology used by Fornleifastofnun Íslands is based upon the single context planning technique developed by the Dept. of Urban Archaeology of the Museum of London and has been further developed and modified for Icelandic conditions by Fornleifastofnun Íslands.

Planning squares were established on a 5m grid, located within a local co-ordinate system (with known fixed points established in ISN93). Each archaeological deposit or feature was planned at a scale of 1:20 by 5m square, and descriptions of each deposit or feature were maintained by means of a unique contextual numbering system and pro-forma recording sheets. This record was augmented with conventional and digital photography as appropriate.

All intact feature fills were dry sieved through a 4mm mesh.

All possible artefacts, bones etc were recovered by contextual unit and 3D location (excepting those recovered by sieving).

The artefacts were examined and treated for stabilisation by Conservator Jannie A Ebsen, of Odense Bymuseet

Results

Figure 2 - Graves and postholes post excavation. UAV photography by Gísli Pálsson

Two adjacent graves cuts were excavated, one containing poorly preserved horse bones and a number of iron objects (768 - north) the other containing no bone, but with a composite wood/bronze object along with iron studs/nails (770 - south). Two human teeth and a possible fragment of skull were recovered just outside of the southern grave.

Grave 768 is interpreted as a disturbed horse burial, associated with Grave 770, a disturbed human burial.

Grave 770 measured up to 1.81m in length, 1.15m in width and up to 0.60m in depth. Grave 768 measured up to 1.55m in length, 0.95m in width and 0.76m in depth. Both graves exhibit substantial undercutting. Both graves had been re-opened in antiquity, and were found to include a fine blue grey tephra (likely H1300) within the upper portion of their fills. All features were sealed by a sequence of mixed aeolian soils and upcast, and by a near contiguous layer of coarse dark grey/black tephra (identified elsewhere on site as V1477). Occasional fist sized sub-angular stones were noted in the grave fills.

Four large stone packed postholes (760, 762, 764, and 766) were discovered and excavated around the southern grave. A smaller posthole (772) was excavated between the graves.

Posthole (760), at the southwest (of grave cut (770)), measured up to 0.30m in length, 0.22m in width and 0.35m in depth. The axis was steeply inclined towards the southeast, and its fill (759) contained substantial quantities of small sub-angular stones, up to 0.15m in length.

Posthole (762), at the southeast, measured up to 0.30m in length, 0.22m in width and 0.45m in depth. The axis was steeply inclined towards the southeast, and its fill (761) contained substantial quantities of small sub-angular stones, up to 0.10m in length.

Posthole (764), at the northeast, measured up to 0.57m in length, 0.26m in width and 0.50m in depth. The axis was steeply inclined towards the northeast, and its fill (763) contained substantial quantities of small sub-angular stones, up to 0.15m in length.

Posthole (766), at the northwest, measured up to 0.32m in diameter and 0.45m in depth. The axis was moderately inclined towards the east, and its fill (765) contained substantial quantities of small sub-angular stones, up to 0.12m in length.

Posthole (772), between grave cuts (768) and (770), measured up to 0.28m in diameter and 0.28m in depth. The axis of inclination was only slightly inclined towards the south, and its fill (771) contained occasional small sub-angular stones, up to 0.10m in length.

It is noted that the axis of inclination of these stone packed postholes is both substantial and wholly inconsistent. It is thought that this must reflect later disruption rather than the original intent or design. It is suggested that the posts were forcibly removed, shortly after use. The function of these posts remains opaque, but must seem to indicate some form of structure covering the grave, if only perhaps on a temporary basis.

The excavated features closely resemble 4 similar grave groups previously investigated. The alignment of this group is nearly north-south, similar to but not wholly consistent with the other grave groups at Ingiriðarstaðir.

Finds (see Appendix 2)

44 finds unit were registered in the field. The great majority of these are iron studs, nails and unidentified objects. A few items are perhaps of greater interest, and distribution of the finds allows some tentative suggestions as to their function, despite the disturbed nature of burials.

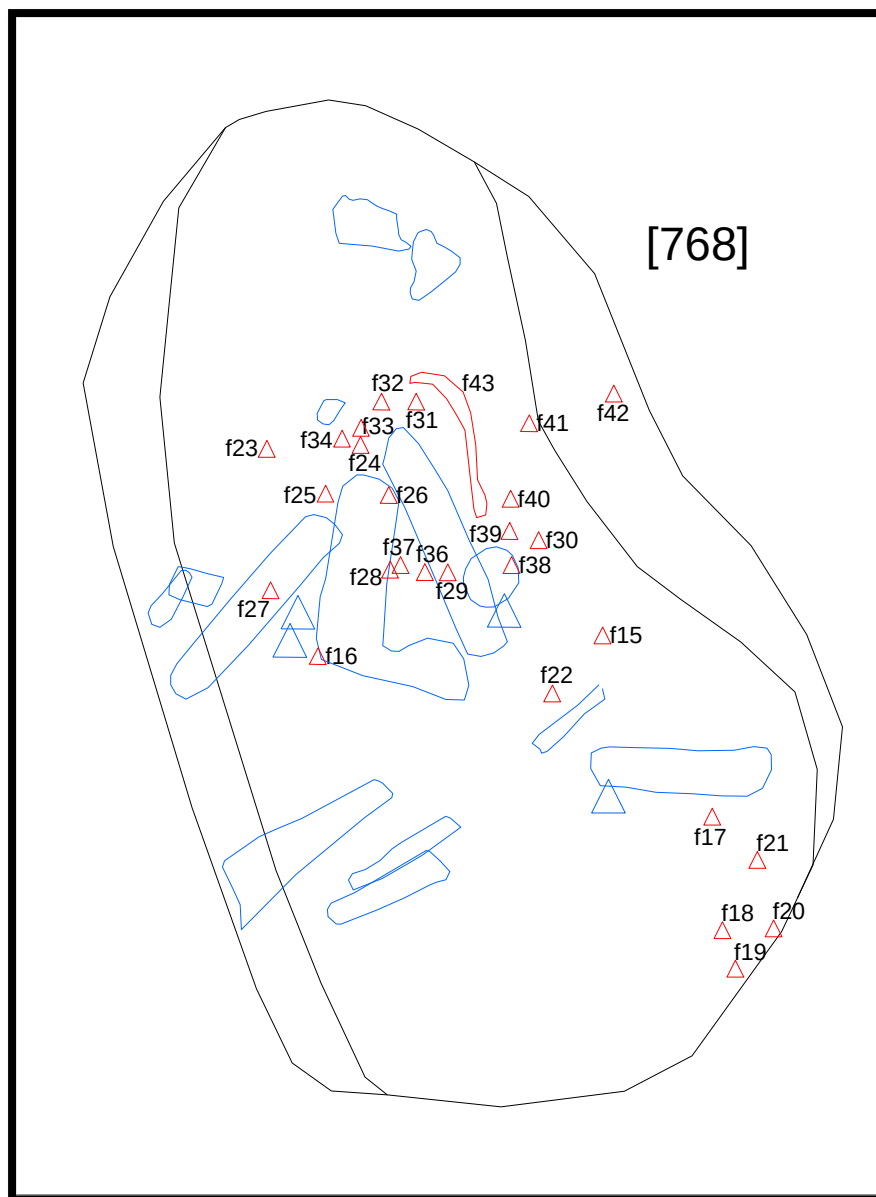

Figure 3 - Finds in grave feature [768].

(Finds in red, horse bones in blue)

The finds cluster broadly in 2 locations. The larger group, associated with fragmentary horse long bones could represent the remains of a saddle.

The smaller (southern) group is associated with a jawbone and tooththrow. It is thought to be the fragmentary remains of a horse harness.

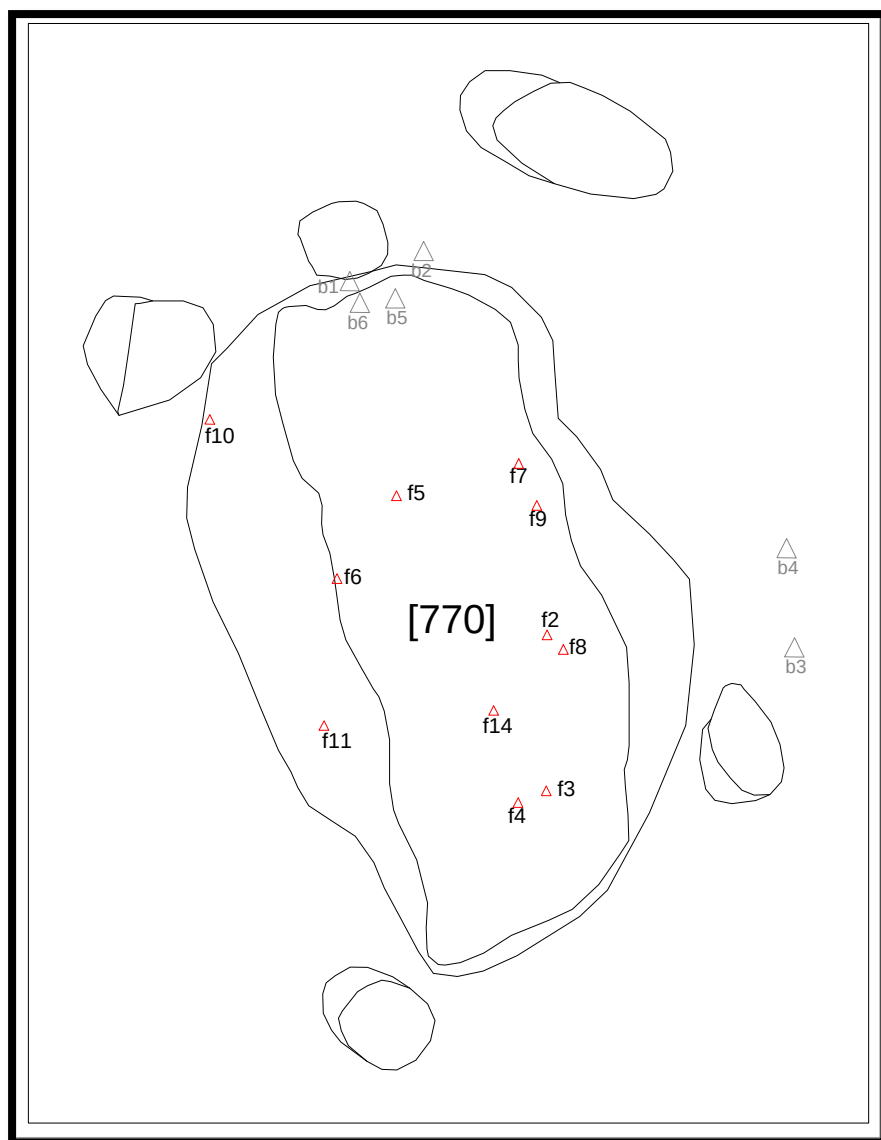

Figure 4 - Finds in grave feature [770].

Only a few small Iron objects, likely nails or studs, were found in layer 756, the primary fill of grave 770 - excepting Find 14-010, a composite object comprising a small copper alloy bowl set within a wooden case or backing. Preliminary research has identified no close parallels for this object - and further study is required.

The form of the copper alloy bowl is unlike known examples identified as balance scales. It might have served to contain unguents, or other precious materials.

Including the wooden casing it measures circa 55mm in both width and breadth. The circular copper bowl itself has a diameter of up to 48mm and is up to 18mm in depth. X ray imaging appears to reveal metal spikes at each corner, presumably retaining the bowl within its housing. The wooden housing is flat at its central base, but is otherwise shaped to follow the form of the bowl.

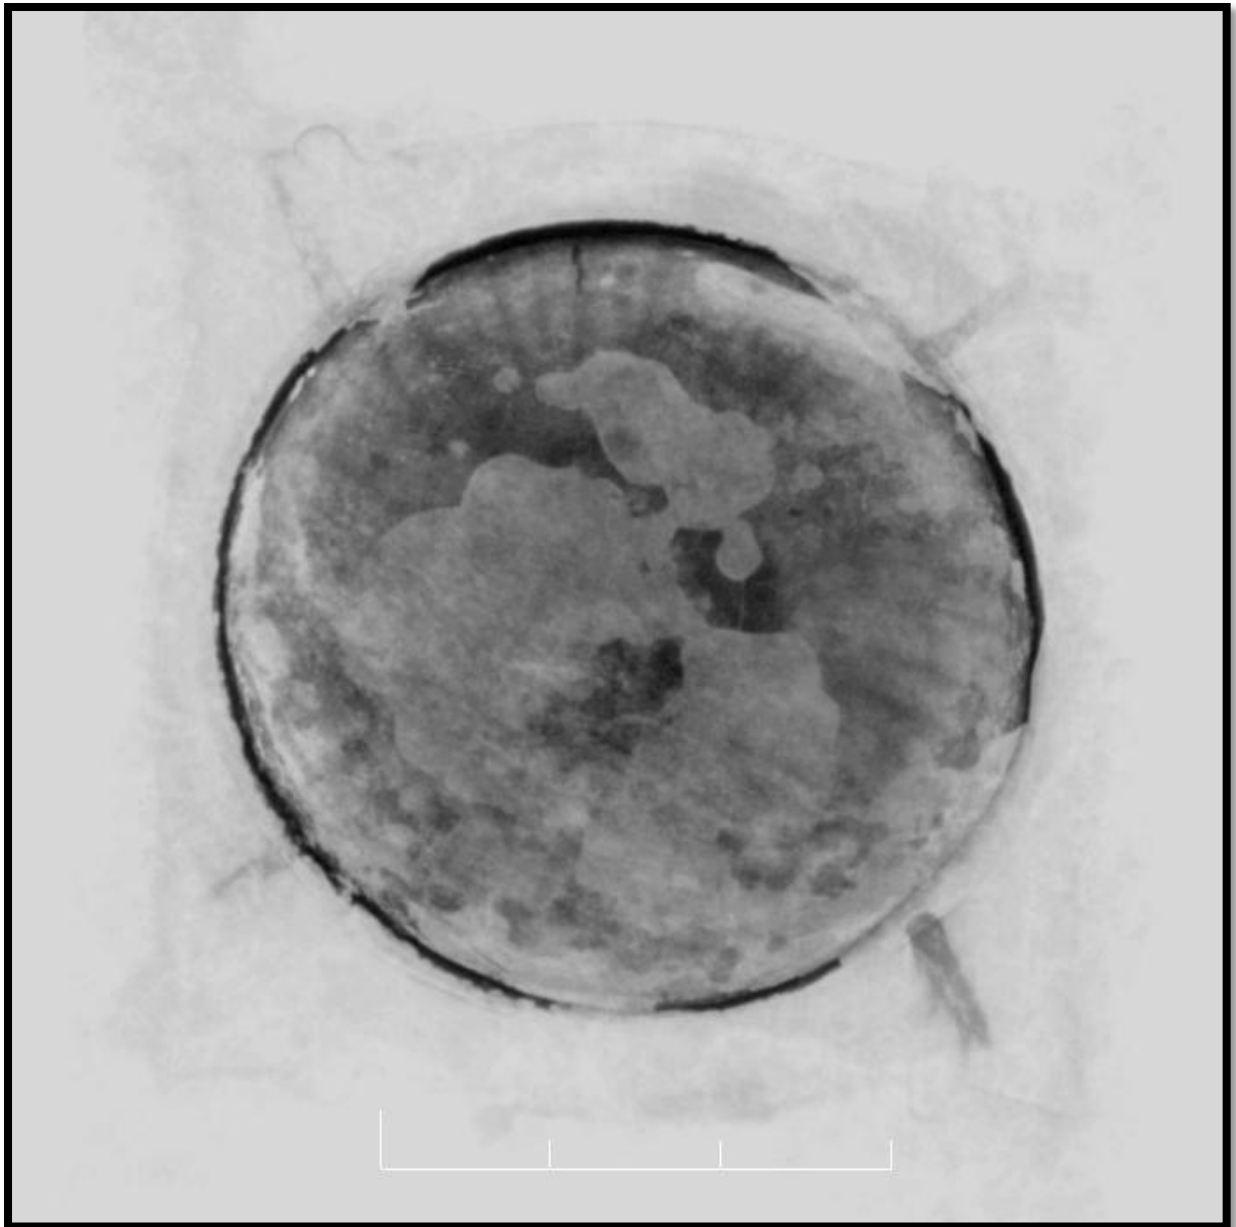

Figure 5 - Find F14-010. Scale is 3cms

Ingiríðarstaðir 2014 - Human remains

Hildur Gestsdóttir

Two items of human bone were discovered in context 738 - a mixed up-cast deposit without the south-eastern portion of grave feature (770).

B-14-003 [738]

Two adult molar crowns, roots broken off post-mortem. Both show significant wear, some acid erosion evident on one of them, which means that using enamel wear to attempt ageing is not possible. Found together. Based on size, colour and shape they most likely belong to the same individual.

B-14-004 [738]

The petromastoid portion of a left temporal bone, belonging to an adult. Age and sex undetermined. The bone is poorly preserved with most of the cortical flaked off.

The teeth and bone all have evidence of weathering, with flaking and whitening, indicating that they were all exposed to the elements for some period after the disturbance of the grave. The minimum number of individuals (MNI) for the collection is one.

Conclusions

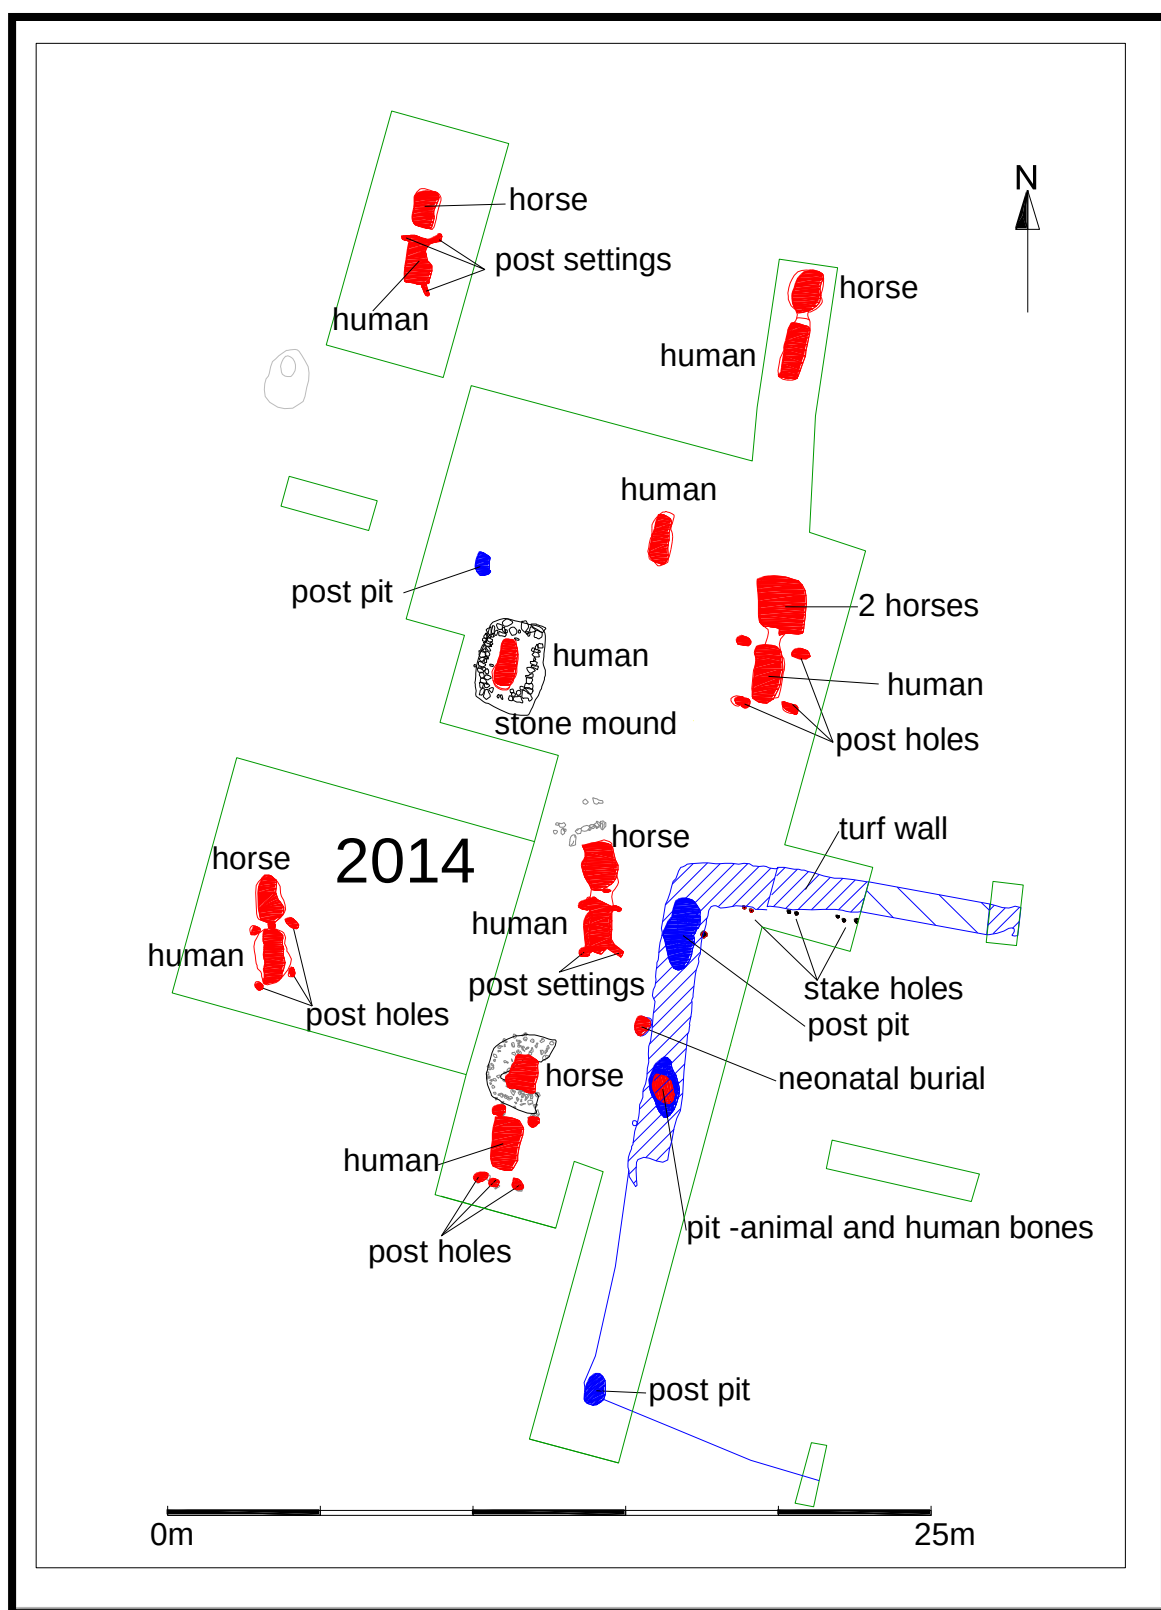

Figure 6 - Site Plan

Features known to date from Ingiríðarstaðir now total 8 adult burials, one child burial, 7 horse burials (in six graves) and a range of interstitial features. It is thought likely that further features await discovery. A further field season is proposed for 2015, focusing on unexcavated areas beyond and between the known finds. Given the scale of the site, future seasons are likely to utilise limited and targeted trial trenching until such time as further features are identified.

The data in this report and its appendices are given in good faith, but may be subject to revision as further excavation and analysis goes forward.

Acknowledgements

We would like to express our thanks to all the landowners for their permission to excavate, to Landsvirkjun for accommodation, and to Bryndís Ívarsdóttir at Staðarhóll for food and all her help. We would also like to thank Unnsteinn Ingason, Baldur Danielsson and the members of Hið Þingeyska Fornleifafélag for all their help and support throughout the years.
